

Krylov subspace method with sparse matrix

Atsushi Suzuki¹

¹R-CCS, Large-scale Parallel Numerical Computing Technology Research Team
`atsushi.suzuki.aj@a.riken.jp`

Linear equation sparse matrix for partial differential eqs.

linear equation with sparse matrix $A \in \mathbb{R}^{N \times N}$ and RHS $\vec{b} \in \mathbb{R}^N$

$$\text{to find } \vec{x} \in \mathbb{R}^N \quad A \vec{x} = \vec{b}$$

from discretization of PDE by finite {element, volume, difference} methods
Laplace equation

$$-\Delta u = - \left(\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right) = f \text{ in } \Omega, \quad u = 0 \text{ on } \partial\Omega$$

square region $\Omega = (0, 1) \times (0, 1)$ and its boundary $\partial\Omega$

discretization with uniform mesh
 $\Delta x = \Delta y = h$ with $(n+1)h = 1$

$$\frac{-u_{i-1,j} + 2u_{i,j} - u_{i+1,j}}{\Delta x^2} + \frac{-u_{i,j-1} + 2u_{i,j} - u_{i,j+1}}{\Delta y^2} = f_{i,j}$$

for unknown value $u_{i,j} \sim u(x, y)$

at $(x, y) = (i\Delta x, j\Delta y)$.

numbering of two dimensional grid by

$\lambda : \{1, \dots, n\} \times \{1, \dots, n\} \rightarrow \{1, \dots, n^2\}$

with $\lambda(i, j) = i + nj$

sparse matrix with five stencil

$$\begin{array}{ccccccc} 2 & -1 & & & & & -1 \\ -1 & 4 & -1 & & & & -1 \\ & -1 & 4 & -1 & & & -1 \\ & & \ddots & \ddots & \ddots & & \\ & & & -1 & 4 & -1 & \\ & & & & -1 & 2 & \\ -1 & & & & 2 & -1 & \\ & -1 & & & -1 & 4 & -1 \\ & & -1 & & & -1 & 4 & -1 \\ & & & \ddots & & \ddots & \ddots & \ddots \\ & & & & -1 & & -1 & 4 & -1 \\ & & & & & -1 & & -1 & 2 \end{array}$$

penta-diagonal matrix with

$$N = n^2, \text{nnz} = (3n - 2)n + 2n(n - 1) = 5n^2 - 4n$$

- ▶ exploiting five stencil pattern
- ▶ storing by general sparse matrix for unstructured pattern

Linear equation and variational problem

$A \in \mathbb{R}^{N \times N}$: sparse matrix, $\vec{b} \in \mathbb{R}^N$

$$\text{find } \vec{x} \in \mathbb{R}^N \quad A\vec{x} = \vec{b} \text{ in } \mathbb{R}^N$$

variational problem with test vector $\vec{y} \in \mathbb{R}^N$

$$\text{find } \vec{x} \in \mathbb{R}^N \quad (A\vec{x} - \vec{b}, \vec{y}) = 0 \quad \forall \vec{y} \in \mathbb{R}^N$$

inner product $(\vec{x}, \vec{y}) = \sum_{1 \leq i \leq N} [\vec{x}]_i [\vec{y}]_i = \vec{x}^T \vec{y}$, ℓ^2 -norm $\|\vec{x}\| = \sqrt{(\vec{x}, \vec{x})}$

$$\blacktriangleright A\vec{x} - \vec{b} = \vec{0} \Rightarrow (A\vec{x} - \vec{b}, \vec{y}) = 0$$

$$\blacktriangleright (A\vec{x} - \vec{b}, \vec{y}) = 0 \quad \forall \vec{y} \Rightarrow \vec{y} = \vec{e}_i \Rightarrow [A\vec{x} - \vec{b}]_i = 0 \quad (1 \leq i \leq N) \Rightarrow A\vec{x} - \vec{b} = \vec{0}$$

subspace $V \subset \mathbb{R}^N$

$$\text{find } \vec{x} \in V \quad (A\vec{x} - \vec{b}, \vec{y}) = 0 \quad \forall \vec{y} \in V$$

$$\vec{r} = \vec{b} - A\vec{x} \perp V \Leftrightarrow \text{residual is orthogonal to } V$$

questions

$$\blacktriangleright A \text{ is invertible in } V ? \Leftrightarrow A : \text{coercive}$$

$$\blacktriangleright \text{how to generate } V ? \Leftrightarrow \text{Krylov subspace method with preconditioner}$$

$$A \in \mathbb{R}^{N \times N} \text{ is coercive in subspace } V \Leftrightarrow \exists \alpha > 0 \quad \forall \vec{x} \in V \quad (A\vec{x}, \vec{x}) \geq \alpha \|\vec{x}\|^2$$

Linear equation and variational problem

Theorem

$A \in \mathbb{R}^{N \times N}$: coercive in $V \exists \alpha > 0 \forall \vec{x} \in V (A\vec{x}, \vec{x}) \geq \alpha \|\vec{x}\|^2$

$\Rightarrow \exists! \vec{x}$ satisfying $(A\vec{x} - \vec{b}, \vec{y}) = 0 \forall \vec{y} \in V$

injectivity and surjectivity of A in V are obtained as follows

- ▶ injectivity : $(A\vec{x}, \vec{y}) = 0 \forall \vec{y} \in V \Rightarrow \vec{x} = \vec{0}$,
putting $\vec{y} = \vec{x}$, $0 = (A\vec{x}, \vec{x}) \geq \alpha \|\vec{x}\|^2 \geq 0 \Rightarrow \vec{x} = \vec{0}$
- ▶ surjectivity : $\forall \vec{b}|_V \exists \vec{x} \in V A\vec{x} = \vec{b}$
 - ▶ The rank-nullity theorem says $\dim V = \text{rank } A|_V + \dim \text{Ker } A$ and then $\dim \text{Ker } A = \vec{0}$ from the injectivity leads to $\dim V = \text{rank } A|_V$
 - ▶ Another proof is given by the orthogonal decomposition of V as $V = \text{Im } A|_V \oplus \text{Ker } A|_V$ with using $\text{Ker } A|_V = \{\vec{0}\}$.

Linear equation with coercive coefficient matrix A is solved by

- ▶ iterative method by incrementally generated subspace $V_1 \subset \dots \subset V_m$
- ▶ direct solver without pivoting (by assuming without rounding-off i.e., theoretical computation)

LU factorization without pivoting for coercive matrix

iterative process of factorization of A as LU

$$A = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & A_{22} \end{bmatrix} = \begin{bmatrix} a_{11} & 0 \\ a_{21} & S_{22} \end{bmatrix} \begin{bmatrix} 1 & a_{11}^{-1}a_{12} \\ 0 & I_2 \end{bmatrix}$$

$S_{22} = A_{22} - a_{21}a_{11}^{-1}a_{12}$: Schur complement generated by rank-1 update

- ▶ $a_{11} \neq 0$ thanks to A is invertible in $V_1 = \text{span}[\vec{e}_1]$
- ▶ S_{22} is coercive on $V_{m-1} = \text{span}[\vec{e}_2, \vec{e}_3, \dots, \vec{e}_m]$
by putting $\vec{x}_1 = -a_{11}^{-1}a_{12}\vec{x}_2$

$$\begin{aligned} 0 &\leq \left(A \begin{bmatrix} -a_{11}^{-1}a_{12}\vec{x}_2 \\ \vec{x}_2 \end{bmatrix}, \begin{bmatrix} -a_{11}^{-1}a_{12}\vec{x}_2 \\ \vec{x}_2 \end{bmatrix} \right) \\ &= \left(\begin{bmatrix} a_{11}(-a_{11}^{-1}a_{12}\vec{x}_2) + a_{12}\vec{x}_2 \\ a_{21}(-a_{11}^{-1}a_{12}\vec{x}_2) + A_{22}\vec{x}_2 \end{bmatrix}, \begin{bmatrix} \vec{x}_1 \\ \vec{x}_2 \end{bmatrix} \right) \\ &= ((A_{22} - a_{21}a_{11}^{-1}a_{12})\vec{x}_2, \vec{x}_2) = (S_{22}\vec{x}_2, \vec{x}_2) \end{aligned}$$

coercivity and other property of matrix

- ▶ coercive : $\exists \alpha > 0 \forall \vec{x} (A\vec{x}, \vec{x}) \geq \alpha \|\vec{x}\|^2$.
- ▶ indefinite matrix does not satisfy coercivity, a simple example:

$$\left(\begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} \begin{bmatrix} 1 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \end{bmatrix} \right) = 0$$

- ▶ For non-coercive case, if A is invertible, there is a unique solution of $Ax = b$. However, direct solver requires proper pivoting procedure. There is not yet mathematical proof on convergence rate of GMRES method for such indefinite matrix system.
- ▶ diagonal dominant : $|a_{ii}| > \sum_{j \neq i} |a_{ij}|$
- ▶ M -matrix : Z -matrix $\wedge \operatorname{Re} \lambda_i > 0$ ($1 \leq i \leq N$), λ_i : i -th eigenvalue
- ▶ Z -matrix $a_{ij} < 0$ $i \neq j$

M -matrix property is obtained from the maximum principle of the Laplace operator. Convergence of Gauss-Seidel method is proven by this property.

overview of Krylov subspace methods

A : symmetric

- ▶ positive definite : CG (conjugate gradient)
- ▶ indefinite : SYMMLQ, MINRES

A : unsymmetric

- ▶ coercive : FOM (full orthogonalization method)
- ▶ general : GMRES (generalized minimum residual),
Orthmin, GCR
BiCG(bi conjugate gradient), CGS , BiCGstab
QMR, TFQMR

$\vec{r}_0 = b - A \vec{x}_0$: initial residual from initial guess x_0

subspaces V and W

find $\vec{x} \in \vec{x}_0 + V$ $(A\vec{x} - \vec{b}, \vec{y}) = 0 \quad \forall \vec{y} \in V$: CG, FOM

find $\vec{x} \in \vec{x}_0 + V$ $(A\vec{x} - \vec{b}, A\vec{y}) = 0 \quad \forall \vec{y} \in V$: Orthmin, GCR

find $\vec{x} \in \vec{x}_0 + V$ $\|A\vec{x} - \vec{b}\| \leq \|A\vec{y} - \vec{b}\| \quad \forall \vec{y} \in \vec{x}_0 + V$: MINRES, GMRES

find $\vec{x} \in \vec{x}_0 + V$ $(A\vec{x} - \vec{b}, \vec{y}) = 0 \quad \forall \vec{y} \in W$: BiCG

Krylov subspaces

$$V = K_n(A, \vec{r}_0) := \text{span}[\vec{r}_0, A\vec{r}_0, A^2\vec{r}_0, \dots, A^{n-1}\vec{r}_0]$$

$$W = K_n(A^T, \vec{r}_0^*) := \text{span}[\vec{r}_0^*, A^T \vec{r}_0^*, (A^T)^2 \vec{r}_0^*, \dots, (A^T)^{n-1} \vec{r}_0^*]$$

Krylov subspace and solution of the linear system : 1/2

- ▶ $A \in \mathbb{R}^{N \times N}$, invertible, $\vec{b} \in \mathbb{R}^N$,
- ▶ $\vec{x}_0$: initial guess,
- ▶ $\vec{r}_0 := \vec{b} - A\vec{x}_0$: initial residual.

Krylov subspace

$$K_n(A, \vec{r}_0) := \text{span}[\vec{r}_0, A\vec{r}_0, A^2\vec{r}_0, \dots, A^{n-1}\vec{r}_0]$$

Lemma

$$A^n \vec{r}_0 \in K_n(A, \vec{r}_0) \Rightarrow A^{n+m} \vec{r}_0 \in K_n(A, \vec{r}_0) \quad \forall m > 0$$

proof by induction, suppose that $A^{n+m} \vec{r}_0 \in K_n(A, \vec{r}_0) \quad m \geq 0$

$$\begin{aligned} A^{n+m} \vec{r}_0 &= \sum_{k=0}^{n-1} \alpha_k A^k \vec{r}_0 \\ A^{n+m+1} \vec{r}_0 &= \sum_{k=0}^{n-2} \alpha_k A^{k+1} \vec{r}_0 + \alpha_{n-1} A^n \vec{r}_0 \in K_n(A, \vec{r}_0) \\ \text{span}[A^0, A^1, \dots, A^{n-1}] &\subset K_n(A, \vec{r}_0) \end{aligned}$$

dimension of the largest Krylov subspace created by A and $\vec{r}_0$.

$$\text{▶ } n_0 := \min_n \{K_n(A, \vec{r}_0) = K_{n+1}(A, \vec{r}_0)\}$$

$$K_1(A, \vec{r}_0) \subset K_2(A, \vec{r}_0) \subset \dots \subset K_{n_0}(A, \vec{r}_0) = K_{n_0+1}(A, \vec{r}_0) = K_{n_0+2}(A, \vec{r}_0) = \dots$$

$$\dim K_l(A, \vec{r}_0) = l \quad 1 \leq l \leq n_0$$

Krylov subspace and solution of the linear system : 2/2

Theorem

$\vec{x}$: solution of linear system $A\vec{x} = \vec{b} \Rightarrow \vec{x} \in \vec{x}_0 + K_{n_0}(A, \vec{r}_0)$.

proof

recalling that $\vec{r}_0, A\vec{r}_0, A^2\vec{r}_0, \dots, A^{n_0-1}\vec{r}_0$: linearly independent.

$\alpha_0 \neq 0$ is ensured, then $\alpha_0 \neq 0$ such that $A^{n_0}\vec{r}_0 = \sum_{k=0}^{n_0-1} \alpha_k A^k \vec{r}_0$.

$$\alpha_0 = 0 \Rightarrow A^{n_0}\vec{r}_0 = \sum_{k=1}^{n_0-1} \alpha_k A^k \vec{r}_0,$$

by applying A^{-1}

$$A^{n_0-1}\vec{r}_0 = \sum_{k=1}^{n_0-1} \alpha_k A^{k-1}\vec{r}_0,$$

$\Rightarrow \vec{r}_0, A\vec{r}_0, A^2\vec{r}_0, \dots, A^{n_0-1}\vec{r}_0$: linearly dependent $\Rightarrow \Leftarrow$

$$\alpha_0 \vec{r}_0 + \sum_{k=1}^{n_0-1} \alpha_k A^k \vec{r}_0 - A^{n_0} \vec{r}_0 = \vec{0} \Leftrightarrow \vec{r}_0 + \sum_{k=1}^{n_0-1} \frac{\alpha_k}{\alpha_0} A^k \vec{r}_0 - \frac{1}{\alpha_0} A^{n_0} \vec{r}_0 = \vec{0}$$

$$\Leftrightarrow (\vec{b} - A\vec{x}_0) + \sum_{k=1}^{n_0} \gamma_k A^k \vec{r}_0 = \vec{0} \Leftrightarrow A \left(\vec{x}_0 - \sum_{k=1}^{n_0} \gamma_k A^{k-1} \vec{r}_0 \right) = \vec{b}.$$

$$\vec{x}_0 - \sum_{k=0}^{n_0-1} \gamma_{k+1} A^k \vec{r}_0 \in \vec{x}_0 + K_{n_0}(A, \vec{r}_0) + \text{uniqueness of the solution : } A\vec{x} = \vec{b}.$$

Krylov subspace and variational solution of the linear system

Theorem

problem (V) to find $\vec{x} \in \vec{x}_0 + K_{n_0}(A, \vec{r}_0)$ $(A\vec{x} - \vec{b}, \vec{y}) = 0 \quad \forall \vec{y} \in K_{n_0}(A, \vec{r}_0)$

has a unique solution and is equivalent to the problem $A\vec{x} = \vec{b}$.

proof

- ▶ $\vec{x}_* \in \vec{x}_0 + K_{n_0}(A, \vec{r}_0)$: solution of (V).
- ▶ $\vec{x}_1 \in \mathbb{R}^N$: solution of $(A\vec{x} - b, \vec{y}) = 0 \quad \forall \vec{y} \in \mathbb{R}^N \Rightarrow \vec{x}_1 \in \vec{x}_0 + K_{n_0}(A, \vec{r}_0)$.
 $(A\vec{x}_1 - b, \vec{y}) = 0 \quad \forall \vec{y} \in K_{n_0}(A, \vec{r}_0) \subset \mathbb{R}^N \Rightarrow \vec{x}_1$: solution of (V).

to verify uniqueness $(A(\vec{x}_1 - \vec{x}_*), \vec{y}) = 0 \quad \forall \vec{y} \in K_{n_0}(A, \vec{r}_0) \stackrel{?}{\Rightarrow} \vec{x}_1 - \vec{x}_* = \vec{0}$
injectivity of A on K_{n_0} is clear when A is coercive.

successive computation of variational problems

do $m = 1, 2, \dots, n_0$

find $\vec{x} \in \vec{x}_0 + K_m(A, \vec{r}_0)$ $(A\vec{x} - \vec{b}, \vec{y}) = 0 \quad \forall \vec{y} \in K_m(A, \vec{r}_0)$

- ▶ Conjugate Gradient (CG) method $\Leftarrow A$: symmetric positive definite
- ▶ Full Orthogonalization Method (FOM) $\Leftarrow A$: coercive

general case, $A : 1$ to 1 on $K_{n_0}(A, \vec{r}_0)$ is verified as

$$\begin{aligned} \vec{z} \in K_{n_0}(A, \vec{r}_0) \text{ satisfying } (A\vec{z}, \vec{y}) &= 0 \quad \forall \vec{y} \in K_{n_0}(A, \vec{r}_0) \\ &\Rightarrow A\vec{z} \in (K_{n_0}(A, \vec{r}_0))^\perp \vee \vec{z} \in \ker A \\ \left. \begin{array}{l} \vec{z} \in K_{n_0}(A, \vec{r}_0) \\ \exists A^{-1} \Rightarrow \ker A = \{\vec{0}\} \end{array} \right\} &\Rightarrow \vec{z} = \vec{0}. \end{aligned}$$

Arnoldi process

$\|\vec{v}_1\| = 1,$
 $\{\vec{v}_1, A\vec{v}_1, A^2\vec{v}_1, \dots, A^{m-1}\vec{v}_1\} \rightarrow$ orthonormal basis $\{\vec{v}_1, \vec{v}_2, \dots, \vec{v}_m\}$
 by Gram-Schmidt

Algorithm (Arnoldi process)

do $j = 1, 2, \dots, m$

$$h_{i,j} = (A\vec{v}_j, \vec{v}_i) \quad 1 \leq i \leq j$$

$$\vec{w}_j = A\vec{v}_j - \sum_{i=1}^j h_{i,j} \vec{v}_i$$

$$h_{j+1,j} = \|\vec{w}_j\|^2$$

$$\vec{v}_{j+1} = \frac{\vec{w}_j}{h_{j+1,j}}$$

from the last line,

$$h_{j+1,j} \vec{v}_{j+1} = A\vec{v}_j - \sum_{i=1}^j h_{i,j} \vec{v}_i,$$

$$A\vec{v}_j = \sum_{i=1}^{j+1} h_{i,j} \vec{v}_i.$$

$$[A\vec{v}_1, \dots, A\vec{v}_m] = [\vec{v}_1, \dots, \vec{v}_m, \vec{v}_{m+1}] \begin{bmatrix} h_{1,1} & h_{1,2} & \cdots & h_{1,m-1} & h_{1,m} \\ h_{2,1} & h_{2,2} & \cdots & h_{2,m-1} & h_{2,m} \\ & h_{3,2} & \cdots & h_{3,m-1} & h_{3,m} \\ & & \ddots & \vdots & \vdots \\ & & & h_{m,m-1} & h_{m,m} \\ & & & & h_{m+1,m} \end{bmatrix}$$

$$AV_m = V_{m+1} \overline{H}_m \quad \overline{H}_m \in \mathbb{R}^{(m+1) \times m} : \text{Hessenberg matrix,}$$

$$V_m^T AV_m = H_m \Leftrightarrow V_m^T V_m = I_m \Leftrightarrow (\vec{v}_j, \vec{v}_i) = \delta_{ij} \quad 1 \leq i, j \leq m$$

Full Orthogonalization Method

- ▶ $A \in \mathbb{R}^{N \times N}$, invertible, $\vec{b} \in \mathbb{R}^N$,
- ▶ $\vec{x}_0$: initial guess,
- ▶ $\vec{r}_0 := \vec{b} - A\vec{x}_0$: initial residual.
- ▶ $K_n(A, \vec{r}_0) := \text{span}[\vec{r}_0, A\vec{r}_0, A^2\vec{r}_0, \dots, A^{n-1}\vec{r}_0]$: Krylov subspace

construction of basis of Krylov subspace by Arnoldi process
starting from $\vec{v}_1 = \vec{r}_0/\beta$, $\beta = \|\vec{r}_0\|$,

$$\begin{aligned}AV_m &= V_{m+1}\overline{H}_m \\V_m^T AV_m &= H_m \\V_m^T \vec{r}_0 &= V_m^T \beta \vec{v}_1 = \beta \vec{\epsilon}_m^{(1)}, \quad [\vec{\epsilon}_m^{(1)}]_i = \delta_{i1} \quad 1 \leq i \leq m\end{aligned}$$

find $\vec{x}_m \in \vec{x}_0 + K_m(A, \vec{r}_0)$ $(A\vec{x}_m - \vec{b}, \vec{y}) = 0 \quad \forall \vec{y} \in K_m(A, \vec{r}_0)$

$$\begin{aligned}\vec{x}_m &= \vec{x}_0 + V_m \vec{\eta}_m \\A\vec{x}_m - \vec{b} &= A\vec{x}_0 - \vec{b} + AV_m \vec{\eta}_m \\&= -\vec{r}_0 + AV_m \vec{\eta}_m \\V_m^T (A\vec{x}_m - \vec{b}) &= -V_m^T \vec{r}_0 + V_m^T AV_m \vec{\eta}_m \\&= -\beta \vec{\epsilon}_m^{(1)} + H_m \vec{\eta}_m, \\\vec{\eta}_m &= H_m^{-1}(\beta \vec{\epsilon}_m^{(1)})\end{aligned}$$

H_m : invertible? A is coercive $\Rightarrow$ yes

Generalized Minimal Residual (GMRES) Method : 1/3

- ▶ $A \in \mathbb{R}^{N \times N}$, invertible, $\vec{b} \in \mathbb{R}^N$,
- ▶ $\vec{x}_0$: initial guess,
- ▶ $\vec{r}_0 := \vec{b} - A\vec{x}_0$: initial residual.
- ▶ $K_n(A, \vec{r}_0) := \text{span}[\vec{r}_0, A\vec{r}_0, A^2\vec{r}_0, \dots, A^{n-1}\vec{r}_0]$: Krylov subspace

construction of basis of Krylov subspace by Arnoldi process
starting from $\vec{v}_1 = \vec{r}_0/\beta$, $\beta = \|\vec{r}_0\|$,

$$AV_m = V_{m+1}\overline{H}_m,$$

bi-conjugate gradient method : 2/3

Lanczos biorthogonalization process

$$[A\vec{v}_1, \dots, A\vec{v}_m] = [\vec{v}_1, \dots, \vec{v}_m, \vec{v}_{m+1}]$$

$$\begin{bmatrix} \alpha_1 & \beta_2 & & & \\ \delta_2 & \alpha_2 & \ddots & & \\ & \delta_3 & \ddots & & \\ & & \ddots & \ddots & \beta_m \\ & & & \delta_m & \alpha_m \\ & & & & \delta_{m+1} \end{bmatrix}$$

$$AV_m = V_m T_m + \delta_{m+1} \vec{v}_{m+1} \vec{\epsilon}_m^{(m)T}$$

$$A^T W_m = W_m T_m^T + \beta_{m+1} \vec{w}_{m+1} \vec{\epsilon}_m^{(m)T}$$

$$W_m^T A V_m = T_m \quad \Leftarrow \quad W_m^T V_m = I_m : \text{bi-orthogonality}$$

two-sided Lanczos algorithm

variational problem with Petrov-Galerkin type

$$\text{find } \vec{x} \in \vec{x}_0 + K_m(A, \vec{r}_0) \quad (A\vec{x} - \vec{b}, \vec{y}) = 0 \quad \forall \vec{y} \in K_m(A^T, \vec{r}_0^*)$$

$$\text{find } \vec{x}_m = \vec{x}_0 + V_m \vec{\eta}_m, \quad \text{by solving } T_m \vec{\eta}_m = \beta \vec{\epsilon}_m^{(1)}$$

Two possibilities of break down

- ▶ $(A\vec{p}_m, \vec{p}_m^*) = 0 \Rightarrow T_m$ becomes singular
- ▶ $(\vec{r}_m, \vec{r}_m^*) = 0 \Rightarrow$ breakdown of Lanczos biorthogonalization process

bi-conjugate gradient method : 3/3

Composite step biconjugate gradient method
stable factorization of T_m with 2×2 block pivots

Bank-Chan 1993

Quasi-Minimal Residual (QMR) method
 V_m generated by look-ahead Lanczos process

Freund-Nachtigal 1991
Parlett-Taylor-Liu 1985

$$\begin{aligned}\vec{x}_m &= \vec{x}_0 + V_m \vec{\eta}_m \\ \vec{b} - A\vec{x}_m &= \vec{r}_0 - AV_m \vec{\eta}_m \\ &= V_{m+1}(\beta \vec{\epsilon}_{m+1}^{(1)} - \bar{T}_m \vec{\eta}_m).\end{aligned}$$

$V_{m+1}^T V_{m+1} \neq I_{m+1}$ in general.

find $\vec{\eta}_m \in \mathbb{R}^m \quad \|\beta \vec{\epsilon}_{m+1}^{(1)} - \bar{T}_m \vec{\eta}_m\| \leq \|\beta \vec{\epsilon}_{m+1}^{(1)} - \bar{T}_m \vec{\eta}\| \quad \forall \vec{\eta} \in \mathbb{R}^m$

to avoid transposed matrix-vector operation

Conjugate Gradient Squared (CGS) method

Sonnenveld 1989

in BiCG with polynomial of degree m , $\vec{r}_m = \phi_m(A)\vec{r}_0$, $\vec{r}_m^* = \phi_m(A^T)\vec{r}_0^*$,

$$\alpha_m = \frac{(\phi_m(A)\vec{r}_0, \phi_m(A^T)\vec{r}_0^*)}{(A\vec{p}_m, \vec{p}_m^*)} = \frac{(\phi_m(A)^2\vec{r}_0, \vec{r}_0^*)}{(A\vec{p}_m, \vec{p}_m^*)}$$

new residual $\vec{r}_m' = \phi_m(A)^2\vec{r}_0$ is computed without multiplication of A^T .

to stabilize / smooth convergence

Bi-Conjugate Gradient Stabilized (BiCGSTAB)

van der Vorst 1992

residual $\vec{r}_m' = \psi_m(A)\phi_m(A)\vec{r}_0$ with smoothing polynomial of degree m ,

$\psi_m(t) = (1 - \omega_m t)\psi_{m-1}(t)$: polynomial with variable t .

convergence analysis of CG

- ▶ A : symmetric positive definite, $\exists \alpha > 0$ $(A\vec{x}, \vec{x}) \geq \alpha \|\vec{x}\|^2 \forall \vec{x} \in \mathbb{R}^N$.
- ▶ $A = V\Lambda V^T$, Λ : eigenvalues, V : eigenvectors $V^T V = I_N$
- ▶ $\vec{x}_*$: solution of $A\vec{x} = \vec{b}$, $\vec{x}_m$: approximate solution by CG
- ▶ $\mathbb{P}_m$: polynomial of degree m .

$$\begin{aligned}\vec{y}_m - \vec{x}_* &= \vec{x}_0 + q_{m-1}(A)\vec{r}_0 - \vec{x}_* \quad q_{m-1} \in \mathbb{P}_{m-1} \\ &= \vec{x}_0 + q_{m-1}(A)(\vec{b} - A\vec{x}_0) - \vec{x}_* = (\vec{x}_0 - \vec{x}_*) + q_{m-1}(A)A(\vec{x}_* - \vec{x}_0) \\ &= (I - q_{m-1}(A)A)(\vec{x}_0 - \vec{x}_*) = r_m(A)(\vec{x}_0 - \vec{x}_*) \quad r_m \in \mathbb{P}_m, r(0) = 1.\end{aligned}$$

$$\text{Galerkin orthogonality } (\vec{b} - A\vec{x}_m, \vec{x}_m - \vec{y}_m) = 0 \quad \forall \vec{y}_m \in \vec{x}_0 + K_m(A, \vec{r}_0)$$

$$\begin{aligned}\alpha \|\vec{x}_m - \vec{x}_*\|^2 &\leq (A(\vec{x}_* - \vec{x}_m), \vec{x}_* - \vec{x}_m) \leq \|A\| \|\vec{x}_m - \vec{x}_*\| \|\vec{x}_* - \vec{y}_m\| \\ \|\vec{y}_m - \vec{x}_*\| &= \|r_m(A)(\vec{x}_0 - \vec{x}_*)\| = \|V r_m(\Lambda) V^T(\vec{x}_0 - \vec{x}_*)\| \leq \|r_m(\Lambda)\| \|\vec{x}_0 - \vec{x}_*\|\end{aligned}$$

$$\begin{aligned}\min_{r_m \in \mathbb{P}_m, r_m(0)=1} \|r_m(A)(\vec{x}_0 - \vec{x}_*)\| &\leq \min_{r_m \in \mathbb{P}_m, r_m(0)=1} \max_{\lambda \in [\lambda_{\min}, \lambda_{\max}]} |r_m(\lambda)| \|\vec{x}_0 - \vec{x}_*\| \\ &\leq C_m \left(\frac{\lambda_{\max} + \lambda_{\min}}{\lambda_{\max} - \lambda_{\min}} \right)^{-1} \|\vec{x}_0 - \vec{x}_*\|\end{aligned}$$

$C_m(k) = \cosh(k \cosh^{-1}(t))$ $|t| \geq 1$: Chebyshev polynomial of the first kind
 $\kappa = \lambda_{\max}/\lambda_{\min}$: condition number

$$\|\vec{x}_m - \vec{x}_*\| \leq 2 \frac{\|A\|}{\alpha} \left(\frac{\sqrt{\kappa} - 1}{\sqrt{\kappa} + 1} \right)^m \|\vec{x}_0 - \vec{x}_*\|$$

short summary on Krylov subspace method

- ▶ CG, FOM, and GMRES are direct method ? yes and no
if exact arithmetic is possible, CG and FOM for a positive matrix (symmetric positive definite or coercive) can find the exact solution after n_0 iterations
- ▶ Due to numerical round of error, orthogonality of Lanczos process is rapidly lost in practice
- ▶ Since we need approximate solution normally, Krylov subspace method is useful with termination of iteration by certain criteria before n_0 iterations
- ▶ FOM and GMRES require to store Arnoldi basis vector and computational complexity of Arnoldi process is large, but by short iterations realized by good preconditioner, these methods are robust and practical.
- ▶ residual of GMRES decreases monotonically but there is still no convergence estimate for indefinite matrices
- ▶ family of BiCG method has no monotonic decreasing in residual and in the worst case bi-orthogonal Lanczos process breaks, though look-ahead technique is employed
